

TRACK & TRACE

OVERVIEW

Track and Trace isn't a buzz word, it's an industry necessity. The FDA has placed new regulatory requirements on all food and feed manufacturers, requiring on-demand verification of source products on a supply chain. I-Control's Track and Trace can generate the quick, accurate, and detailed reports you need to meet these requirements.

I-Control's three reports can help you query information by requesting specific production runs or a specific item's lot code allowing you to:

- 1 Identify lots crossing in a specific bin
- 2 Track a raw ingredient from receiving, through the manufacturing process, and as they are loaded out or packed
- 3 Track batches from load out to the raw ingredients

In the event of a product recall, you won't have time to "wish" you had put the right processes in place beforehand. Instead, you'll need the ability to respond quickly to determine which items are contaminated and minimize the damage. With I-Control's new Lot Tracking reports, facilities can trace a product from receiving to load-out, identify all batches and runs in which that material was used and identify any cross contamination in a matter of minutes.

FEATURES

- Produce tracking reports within minutes
- Identify co-mingled lots easily
- Automate forward and backward tracing
- Highlight specific runs that are in question
- Access historical and real time reports
- Report on issues from any point in the manufacturing chain

BENEFITS

- Identify and minimize your recall window
- Maintain consumer confidence and protect your brand
- Develop the reports you need so you can move quickly from gathering information to correcting the identified problem
- Satisfy government regulations

The ability to track a raw material or a specific lot of a product is no longer a luxury but a business requirement. I-Control's Track and Trace reports offer peace-of-mind that you'll be prepared if the worst should happen.
